Mayukh Rooj

DevOps Engineer | Site Reliability Engineer (SRE) | Cloud Infrastructure

mayukhrooj@outlook.com | +91-8788006333 | linkedin.com/in/mayukhrooj | github.com/mayukhrooj

Professional Summary

DevOps and SRE engineer with ∼6 years owning production reliability for trading, card-issuing, and regulated banking platforms on AWS, Azure, and GCP. Accountable today for a multi-region trading platform serving 60K+ traders across 100+ countries, sustaining 25K+ req/sec at sub-50ms p99 with zero customer-impacting outages. Build reliability practice from the ground up – SLO frameworks, incident-management programs, and service-mesh rollouts – alongside 120+ production deploys per week and $430K+ in annualized cloud and tooling savings across two platforms. Technical lead for PCI-DSS and ISO 27001, clearing 3 audits and 2 bank-partner security reviews with zero major findings.

Technical Skills

Cloud Platforms: AWS (EKS, EC2, IAM, VPC, KMS), Microsoft Azure (AKS, Azure DevOps), Google Cloud Platform (GCP)

Containers & Orchestration: Kubernetes (K8s), Docker, Helm, Linkerd (service mesh), mTLS, canary and progressive delivery

Infrastructure as Code (IaC): Terraform, Ansible, Linux (kernel and sysctl performance tuning), Nginx

CI/CD & Automation: GitHub Actions, Jenkins, Azure DevOps Pipelines, Git

Observability & Monitoring: Datadog, Prometheus, Grafana, OpenTelemetry, Jaeger, SigNoz, distributed tracing, structured logging

Languages & Scripting: Python, Go, Bash, YAML

Reliability Engineering: SRE practices, SLI/SLO/SLA design, error budgets, incident management, on-call, runbooks, blameless post-mortems, low-latency and tail-latency tuning, disaster recovery (DR), multi-region and active-active architecture

Security, Compliance & FinOps: PCI-DSS, ISO 27001, NIST, CIS Benchmarks, least-privilege IAM, secret management and rotation, audit logging, vulnerability scanning, FinOps and cloud cost optimization, chargeback reporting

Professional Experience

DevOps Engineer **July 2025 – Present**

Axi Technologies | *Hybrid*

- Own production reliability for a multi-region Azure trading platform serving 60K+ traders across 100+ countries, spanning order routing, market data ingestion, exchange connectivity, risk, and post-trade services.
- Architected fault-tolerant, active-active infrastructure across 3 Azure regions for trade execution, sustaining 25K+ req/sec at peak market hours at sub-50ms p99 with zero customer-impacting outages over the last 4 quarters.
- Tuned Linux kernel parameters on latency-critical AKS nodes – socket buffers, TCP backlog, conntrack limits, NIC IRQ affinity, and CPU pinning – reducing tail latency and packet loss on the order-routing path at peak market hours.
- Instituted SLA and SLO frameworks for 35+ services with engineering leads – error budgets, blameless review cadences, and reliability scorecards – cutting sev-1 and sev-2 escalations by 40%.
- Cut $28K/month from Azure and Datadog spend through rightsizing, log volume tuning, retention policies, and metric cardinality cleanup, with no loss of critical telemetry.
- Deployed Linkerd service mesh to every production service on the platform, enforcing workload-to-workload mTLS and unlocking canary releases and traffic splitting that reduced deployment-related incidents by 45%.
- Compressed average deploy time from 35 minutes to 9 and sustained 120+ production deploys per week by automating CI/CD and infrastructure provisioning in Azure DevOps and Terraform across business units.
- Hardened security and compliance posture for a regulated brokerage through IAM segmentation, secret rotation, centralized audit logging, and recurring DR drills mapped to financial-services controls.

DevOps Engineer L2 **October 2024 – July 2025**

Vegapay | *On-site*

- Ran platform infrastructure for a regulated, multi-tenant B2B card-issuing and lending stack serving banks and NBFCs, processing card transactions, UPI credit flows, and partner loan disbursals.
- Drove MTTA from 18 minutes to 4 and MTTR down by roughly 55% by building an on-call and incident-management program from scratch – alerting stack, escalation matrix, rotations, and runbooks – across 18 services and 6 teams.
- Led an AWS-to-Azure migration of 14 production services in 6 months for a bank-grade workload, defining landing zones, network segmentation, IAM hierarchy, KMS-backed storage, and DR strategy while holding cutover downtime under 5 minutes per service.
- Eliminated roughly $8K/month in cloud waste while transaction volumes grew, directing FinOps across AWS, Azure, and GCP through standardized tagging, per-partner chargeback reporting, and rightsizing and scheduled shutdowns driven with service owners.
- Served as technical lead for PCI-DSS, ISO 27001, NIST, and CIS controls in a card-issuing context, mapping infrastructure, logging, access, and key-management controls to requirements and clearing 3 audits and 2 bank-partner security reviews with zero major findings.
- Embedded observability into new card and lending launches so feature teams could operate their own services.

Software Development Engineer I (SDE-1) **November 2023 – September 2024**
Emint (backed by Quantbox Research) | *On-site*

- Reduced production MTTR from 45 minutes to 15 by introducing distributed tracing across 10 microservices with Jaeger and SigNoz, instrumenting critical paths alongside engineering teams.
- Migrated 8 services from ad-hoc deploys to Kubernetes, provisioning clusters, standardizing Docker images, authoring Helm charts, and establishing a patch-management cadence for cluster add-ons.
- Defined a service observability baseline – metrics, structured logs, alerts, and health checks – and onboarded 10 services to it, improving alert signal-to-noise and enabling SRE-style incident response.
- Trimmed lower-environment cloud spend by roughly 35% through automated billing guardrails for non-production, including scheduled shutdowns and storage lifecycle policies.

DevOps Engineer **January 2022 – November 2023**
Orocorp Technologies | *Remote*

- Shortened new-service onboarding from 5 days to 4 hours by delivering a greenfield AWS platform on Terraform, Ansible, GitHub Actions, and Datadog, defining the IaC structure, CI/CD patterns, and monitoring standards adopted across the engineering org.
- Containerized 12 legacy services with Docker and owned the full Kubernetes cluster lifecycle – upgrades, patching, and add-ons – completing 6 upgrades with zero customer-impacting downtime.
- Enforced least-privilege IAM, integrated centralized secret management, and embedded vulnerability scanning into CI/CD pipelines, shifting security checks left of production.
- Automated VPN provisioning with Terraform and Ansible for a 150+ person remote workforce, replacing manual setup with centrally managed, version-controlled access.

DevOps Engineer **June 2021 – January 2022**
Monsoon Fintech | *Remote*

- Lowered repeat incidents by 30% by introducing runbooks while running day-to-day production operations, including incident triage, performance tuning, and blameless post-mortems.
- Replaced manual server setup with repeatable, version-controlled workflows by codifying VM provisioning and configuration in Terraform and Ansible.
- Built a CI pipeline with Git hooks, GitHub Actions, and Jenkins that caught 70% of regressions before they reached production.
- Implemented an Azure Machine Learning pipeline spanning data preparation, training, deployment, and monitoring, giving the data team a structured path to production ML workloads.

Education

B.Tech, Information Technology | Minor in Cyber Security May 2020
MIT Academy of Engineering, Savitribai Phule Pune University

Certifications

Deep Learning Specialization – DeepLearning.AI / Coursera (Credential ID: 7TPFEJNAMSD3)

Publication

Blockchain and the Identity-Based Encryption Scheme for High Data Security – IEEE, March 2020 (ID: 9076552). Proposed a blockchain-based system for secure private document storage using consensus algorithms and cryptographic hashing for data integrity and authentication.
